ORIG. PUB.	:	Rev Chim, 9, No 7-8, 447-450 (1954)	
ABSTRACT	:	The electrolytic process for the production of sorbitol has been investigated. A flow sheet for the process is given and conditions for its operation are described. The effect of the nature of the cathode, temperature, and current density on current efficiency and yield of product has been investigated. Optimum reduction conditions have been determined, assuring 50-60% current efficiencies and 98% product yields. The advantage of the electrolytic process for the production of sorbi-

Engineer, Candidate of Technical Sciences

TITLE: On the Electrolytic Production of Metallic Titanium

PERIODICAL: Revista de Chimie, 1960, Vol. 11, No. 7, pp. 384 - 390

TEXT: Subject article deals with the electrolytic production of titanium. First, the authors present a brief historical review on various methods of electrolysis, i.e., the electrolysis of molten oxides, the electrolysis of molten titanium halogenes, and the electrolysis of molten titanates, and list the following scientists, who were engaged in the development of one or the other method: Borchers and Huppertz; Skliarenko and Lipkes (Ref. 3); Sibert, McKenna, Steinberg and Wainer; Hatschek (Ref. 2); Kratky and Bruchner; Fischer and Dorsch; Cordiner and Worner; Okada and Kawane; Topinka and his co-workers Burgess and Roberts; Brenner and Sendereoff; Steinberg, Carlton and Wainer (Ref. 12). The last four scientists conducted a detailed study on the electrolysis of potassium fluoritanate (Ref. 12). Subject experiments refer to the production of metallic titanium by the electrolysis of potassium fluoritanate, dissolved in

On the Electrolytic Production of Metallic Titanium

sodium chloride molten in a protective atmosphere of argon ($K_2TiF_6 - NaCl$). The laboratory apparatus consists of: a) the argon purifying installation, and b) the electrolysis cell. The argon purifying installation is used for the removal of various impurities, i.e., oxygen, nitrogen and water. The electrolysis cell consists of the cell itself and the heating furnace. The operation temperature ranged from 700°C to 820°C, with 760°C as the most efficient temperature. The current intensity varied from 10 to 30 amp, and the current density from 120 to 750 amp/dm². The voltage on the plugs of the cell was 5 - 6 v. Table 1 presents the values of the intensity and voltage in function of the time. The electrolysis procedure lasted 1 - 2 h and the cooling procedure 2 h. The deposited titanium was introduced into distilled water of 60°C maximum, where the salt content of the deposited metal was dissolved. The drying was performed in a vacuum at a temperature lower than 60°C. Coal, oxygen and iron are impurities which are present in larger quantities. Reference is made to the source of these impurities and to some methods of reducing them. The "Debyogram" (Fig. 8) performed on a laboratory sample shows that this sample has parameters which are very close to the parameters of a product with a purity of 99.9%, indicated in technical literature. Table 3 presents some values computed on the basis of the "Debyogram" and compared with some values of usual titanium and 99.9% pure tita-

TITLE: Electrolytic Production of Zirconium Metal ✓

PERIODICAL: Revista de Chimie, 1960, Vol. 11, No. 9, pp. 509 - 512

TEXT: Subject article deals with the method of electrolysis for the production of pure zirconium metal. Its production was studied by Troest, Marden and Rich; Driggs and Lilliendahl; Kroll and assistants; Steinberg and assistants (Ref. 2); Creamer, Chambers and White; Raynes, Thelleman, Steinberg and Wainer (Ref. 3); Anchieux and Dauphin, and Chauvin, Coriou and Huré (Ref. 4). In a previous work (Ref. 5) the authors published some experimental data in the electrolytic deposition of titanium metal. The data presented in subject article were obtained in the same apparatus (Figs. 1 and 2). The experimental procedure is based on the electrolysis of potassium fluozirconate, dissolved in molten sodium chloride. The authors studied the influence of the following parameters in the efficiency of substance and current: a) current density; b) temperature; c) composition of the electrolyte; d) electrolysis time; e) shape of the anode; and f) nature of the cathode. a) The current density has a complex influ-

Electrolytic Production of Zirconium Metal

ence depending on the interval of the current density at which the work is performed, on the dimensions and the shape of the cell, and on the dimensions of the cathode. A high current density proved to be advantageous (Table 1). b) Influence of temperature (Table 2): A temperature of 800°C represents a minimum value. By increasing it to 850°C, the deposition procedure is improved. Above this temperature, the variations are smaller. Thus, 850°C are the maximum limit.

c) Influence of the composition of the electrolyte (Table 3): Practically it proved to be advantageous to select a ratio of $K_2CrF_6/NaCl$ equal to 1/2. d) Influence of the electrolysis time (Table 5): The most advantageous electrolysis time was found to be 2 - 2.5 h. e) Shape of the cathodes (Table 6): Only cylindrical and truncated cone-shaped cathodes were tested, but they proved to be identical in their efficiency. f) Nature of the cathodes: With regard to the current efficiency, the nature of the cathodes has no influence on the procedure but influences the purity of the product. Steel and graphite cathodes have been excluded. Comparing a "V2A" cathode with a nickel cathode, the iron content of the zirconium produced was by 0.5% higher in case of the "V2A" cathode. Molybdenum cathodes are too expensive. The electrolytic zirconium was analysed spectrographically to establish the content of Cr, Cu, Mn, Sr, Al, Si, Fe and Hf. Ni and Ca could not be found. The spectrographical analysis was accomplished

Electrolytic Production of Zirconium Metal

together with the Physicist M. Sterghiu. The iron content of about 0.1% was accurately determined by chemical analysis. It is possibly due to the steel lining of the electrolytic cell. The content of hafnium, being approximately 0.01% does not modify the properties of zirconium. After an X-ray examination, no gaseous impurities were found. Table 7 presents the Debyograms performed by the Physicist A. Ciocan. There are 7 tables, 2 photographs and 9 references: 4 Soviet, 1 Rumanian, 2 English, 1 French and 1 Hungarian.

Materials.

Orig Pub : Bul. Inst. politehn. Iasi, 1956, 2, No 1-2, 321-330.

Abstract : In connection with production requirements, measurements were made of the heat conductivity of many commercial materials (raw and half-finished). A method is used, which is a version of the classical method of Greter and Jakob et al. (see Mekheyev, M.A., "Osnovy teploperevodchi" (Principles of Heat Transfer) M-L, Energoizdat, 1949, pages 308-313). The determination of the heat conductivity is carried out by measuring the difference of temperatures, due to the flow of heat between plane-parallel surfaces of the investigated specimen in the form of a cylindrical disk or

la un adult. Xeroderma pigmentosum with epitheliomatous
destructions in an adult DERM.-VENEROL.(Bucuresti) 1957, 2/1
(56-62) Illus. 2

In connection with a rare clinical observation of xeroderma pigmentosum in a 52-year-old adult, the authors discuss the aetio-pathogeny of this disease, emphasizing the part played by the metabolism of proteins, choline, and cholesterol, the chemical structure of which resembles that of cancerogenic substances which cause malignant growths in animals. Besides the metabolic factor, a strong stimulant of the nervous system also intervenes: UV rays, with their elective photo-dynamic effect upon these organisms with morbid predispositions, cause the onset of malignant growths which lead almost inevitably to the patient's death before puberty. The explanation of the survival in the present case might consist in the relatively late onset of the first cutaneous symptoms - at the age of 5 - as well as in the benign character of the whole process and of the malignant growths, which, although subjected to repeated surgical treatment - excision of the right portion of the nasal pyramid, of the left eye-globe, of a portion of the lower lip - failed to result in the invasion of the organism by lymph node, and visceral metastases. The patient's occupation was also a factor which contributed to a more benign course of the disease - as a joiner, he was sheltered from the ill-effects of sun-rays.

The following diseases are included in the sphere of chronic infantile pneumopathies; primary and secondary tb, chronic interstitial pneumopathies, bronchiectases, cysts, chronic abscesses, chronic atelectasis, sclerosis, pulmonary or pleuropulmonary suppurations. Adenotonsillectomy is an adequate and safe operation. Its indications are comparatively more frequent in infantile pneumology than in normal children. It is particularly indicated in chronic pulmonary diseases with hardly reversible or even irreversible lesions. Removal of the adenotonsillar focus may inhibit the sclerosuppurative tendency in certain cases of pulmonary tb and of chronic interstitial pneumopathies.

ABSTRACT: In need of dinitrile and certain esters of the β,β -diphenylglutaric acid for stereochemical investigations, and not possessing the necessary recipe for the production of the acid and its diethyl ester (N. L. Phalnikar, K. S. Nargrund, J. Univ. Pumbay, 5, 1956, (pt. 2), 105), the authors tried to synthesize the dinitrile by adding acetonitrile to the nitrile of β -phenylcinnamic acid. The method for synthesizing β,β -diphenylglutaronitrile and, from it, the β,β -diphenylglutaric acid described in the article is very convenient and in contrast with the recently published method of T. C. Bruice and W. G. Bradbury (J. Organ. Chem., 28, 1963, 3403) it offers also the possibility of easy preparation of monoamide and amide of the same acid. This paper was presented by Academician D. Ivanov on 22 January 1965.

"Effect of Ferredoxine on Hydroxylamine Photooxidation in Isolated Chloroplasts

Sofia, Doklady Bolgarskoy Akademii Nauk, Vol 19, No 12, 1966, pp 1191-1194

Abstract: [English article] Earlier investigations indicated (S. Vaklinova, Compt. rend. Acad. bulg. Sci., 17, 1964, No 3, 282) that hydroxylamine (HA) oxidizes to nitrite in a suspension of chloroplasts and their fragments under the influence of light. Recently, the role of protein containing iron in a nonchemical form and with a redox potential ($E_o = -0.432$ V at pH 7.5) with 100 V more negative than the redox potential of pyridinenucleotide, in primary photosynthetic reactions has become known. L. P. Mortenson et al. (Biochem. Biophys. Res. Commun., 7, 1962, p. 448) gave the name of ferredoxin (Fd) to this protein. Its role in the primary processes of photosynthesis consists in the transfer of electrons released in the primary photochemical act of NADP. Proceeding from these data the authors studied the effect of this enzyme on the intensity of HA photooxidation. For that purpose ferredoxin was isolated from a homogenate of young spinach leaves by means of strongly cooled acetone. The article describes the actual photooxidation and the isolation of chloroplasts. A comprehensive

Title : Content of Carotenoids and Their Derivatives in Corn
Flour as a Function of Degree of Milling.

Orig Pub : Probl. Agric., 1957, 9, No 6, 36-43

Abstract : Carotenoid (C) content in 3 types of corn flour was in-
vestigated, in relation to the nature of milling in
different cuts obtained by fractionization of the grist.
The content of C and zeaxanthine differs from that of
the whole flour. With the decrease of yield %, C and
zeaxanthine content in the flour grows. It has been
found that in flour samples with yields of: 0-30; 0-45
and 0-70, the content of C and derivatives is always
higher than corresponding content in the flour: with

ANGELIUTZI, TH.

Angelutz, Th. Le développement d'une fonction analytique en termes fondamentales d'un noyau. Bull. Sci. Ecole Polytech., Paris, Annexe 12, 14-16 (1945).

Let C be a rectifiable simple closed curve C (for simplicity surrounding the origin) be interior to a given domain D . Let C_1 be the transform of C under a stretch of ratio $1/r$, center the origin, where the constant $r < 1$ is chosen small enough so that C_1 also lies interior to D ; so C_1, C_1 have the respective equations $C_1 = \rho(\theta)$, $C_1, \rho = \rho(\theta)$. From Cauchy's integral formula one obtains for z on C and for every function $f(z)$ analytic in D with $z = \rho(\theta)e^{i\theta}$

$$f(z) = \int_{C_1}^{\infty} k(\omega, \theta)f(\omega)d\omega, \quad k(\omega, \theta) = \frac{e^{i\theta}}{2\pi i \rho(\theta)e^{i\theta} - r\rho(\omega)e^{i\theta}}$$

and from $k(\omega, \theta)$ a new kernel $V_1(\omega, \theta) = \int_{C_1}^{\infty} k(\omega, \omega')k(\theta, \omega')d\omega'$ is formed (in the conjugate imaginary of k). The eigenfunctions (or V_1) define a sequence of functions $\{v_n(z)\}$, analytic in and on C , and it is shown that $f(z)$ has the expansion $f(z) = \sum v_n V_n(z)$, uniformly convergent in and on C . The coefficients $\{c_n\}$ are expressed by means of an integral formula.

Vol. 8 Nod

Annals of the Soviet Academy of Mathematics, Mathematics, Transactions 22, 61-90

(1954)

On the determination of the index of a rational function

Mathematics, Transactions 22, 61-90

beral polynomials with $p \geq 0$ and with no zeros to determine.

In order to determine the Cauchy index I of the rational

function V/U by use of the Sturm sequence U, V, V_1, \dots, V_n ,

the author shows that the term of highest degree in V_k is

essentially

$C_k(x) =$

$$\begin{vmatrix} a_{k-p} & b_{k-p+1} & b_{k-p+2} & \dots & b_{m-p+3} \\ 0 & a_{k-p} & b_{k-p+1} & b_{k-p+2} & \dots \\ 0 & 0 & \dots & b_{k-1} & b_k \\ a_0 & a_1 & \dots & a_{m-p+3} & a_{m-p+4} \\ 0 & 0 & \dots & a_{k-1} & a_k \end{vmatrix}$$

where $a_k = 0$ if $k < 0$ or $k > m$, and $b_k = 0$ if $k < 0$ or $k > n$.

Thus $I = V_{n+1}/V_m$, where V_{n+1} and V_m denote the number

of variations of sign in the sequences $a_0, a_1, \dots, C_1(x), \dots, C_n(x)$

for $x = p + \infty$ and $x = -\infty$, respectively. Finally, this result

is applied to a derivation of (1) Hermite's theorem that f

is the difference between the number of zeros of $U+IV$

having negative imaginary parts and those having positive

imaginary parts. (2) Hurwitz's criterion that all the zeros

of a polynomial have negative real parts. — M. Marden.

Ongheluță, M.

Angheluță, M. On an upper limit for the moduli of the roots of an algebraic equation. *Gaz. Mat., București* 54, 300-311 (1940). (Romanian)

The author gives an elementary proof of Walsh's theorem that all the zeros of the polynomial $f(z) = z^n + a_{n-1}z^{n-1} + \dots + a_0$, lie in the circle $|z| \leq R = \sqrt[n]{|a_0|/|a_n|}$. Let a sequence $\{P_k(z)\}$ of polynomials be defined by the recursion formula $P_k(z) = P_{k-1}(z) + Q_k(z)$ (for $k = 1, 2, \dots, n$), with $P_0(z) \neq 1$ and $P_k(z) \neq 0$ for $|z| > R$. The author proves by induction on k that $|Q_k(0)| = |P_k(0)|/R^k$. The author proves by induction on k that all the coefficients in each $Q_k(z)$ are positive. Hence, that all the moduli of the roots of $P_k(z) = 0$ for $|z| \geq R$. (Walsh's original proof [J. Math. Phys. 9, p. 98, of the reviewer's link was also elementary.] Cf. ex. 9, p. 98, of the reviewer's link (fourth preceding review).)

ANGELUȚĂ, Theodor

Angheluță, Theodor. The number of roots with positive imaginary parts of an algebraic equation. Acad. Repub. Pop. Române Bul. Sti. Ser. Mat. Fiz. Chim. 2, 129-136 (1950). (Romanian. Russian and French summaries)
 Let $\alpha_i (0 \leq i \leq n)$ be $n+1$ complex numbers, set

$$F(x) = \sum_{i=0}^n \alpha_i x^{n-i}, \quad F_0(x) = \sum_{i=0}^n \beta_i x^{n-i},$$

Let $(*)$ $F(x) = 0$ have the roots $\alpha_i (1 \leq i \leq n)$, all distinct, and assume that $F(x)$ is not divisible by any polynomial with real coefficients. The author establishes a sequence whose permanences of sign are equal to the number of roots of $(*)$ with positive imaginary parts. Use is made of the following theorem of Hermite [Oeuvres, tome 1, Gauthier-Villars, Paris, 1905, pp. 197-114; J. Reine Angew. Math. 52, 39-51 (1856)].

$$F(x) = \sum_{m=1}^n \frac{(-1)^{m+1}}{\gamma_m(m)} (x + \alpha_1)x + \cdots + \alpha_1^{n-m} x^m).$$

Then γ_m has real coefficients and if we reduce it by a real linear transformation to a sum of squares, the number of positive sign changes is equal to the number of roots of $(*)$ with positive imaginary parts. Taking the new variables z_i

Vol. 13 No. 6

1/1/2

$(0 \leq z \leq -1)$ defined by $\frac{\partial v}{\partial z} = 2v, \frac{\partial v}{\partial w} = -2v$

$$v = \sum_{n=0}^{\infty} \frac{(-i)^n}{n!} u_n(z)$$

where $u_n(z)$ are linear polynomials in the variables z . Using the expansion $\frac{1}{(2-z)^k} = \frac{1}{2^k} \cdot \frac{1}{(1-\frac{z}{2})^k} = \sum_{n=0}^{\infty} \frac{(-1)^n}{2^n n!} \binom{n+k-1}{k-1}$, the author shows that $v = \sum_{n=0}^{\infty} (-1)^n \frac{1}{2^n n!} u_n(z)$. In order to find the number of positive squares of v use is made of an identity involving determinants formed with the coefficients a_1, a_2 and a_3 .

obtaining finally the following result: Define the real determinants

$$\begin{matrix} a_1 & a_2 & a_3 \\ a_2 & a_3 & a_1 \\ a_3 & a_1 & a_2 \end{matrix} \quad \begin{matrix} u_1 & u_2 & u_3 \\ u_2 & u_3 & u_1 \\ u_3 & u_1 & u_2 \end{matrix}$$

$$D = \begin{vmatrix} 0 & 0 & 0 \\ 0 & 0 & 0 \\ 0 & 0 & 0 \end{vmatrix}$$

Using the expansion $\frac{1}{(2-z)^k} = \frac{1}{2^k} \cdot \frac{1}{(1-\frac{z}{2})^k} = \sum_{n=0}^{\infty} \frac{(-1)^n}{2^n n!} \binom{n+k-1}{k-1}$, the number of positive imaginary parts of the permanences equals the number of roots of (*) with negative imaginary parts. Starting from the equation $(-1)^n P(n) = 0$, we obtain correspondingly a sequence of determinants $1, D_1, \dots, D_n$ such that the number of permanences of this sequence equals the number of roots of (*) with negative imaginary parts. A necessary and sufficient condition that all roots of (*) have negative imaginary parts is, therefore, $D > D(1 \leq z \leq -1)$. This contains as a particular case a classical theorem of Hurwitz [Math. Ann. 46, 273-284 (1895) = Mathematische Werke, Bd. 2, Barthäuser, Basel, 1933, pp. 533-545].

PHASE I BOOK EXPLOTTATION

RUM/3783

Cluj, Transylvania. Institutul Politehnic

Lucrări științifice (Scientific Works) Cluj, Intreprinderea Poligrafica, 1959.
637 p. Errata slip inserted. No. of copies printed not given. No
contributors mentioned.

PURPOSE: This book is intended for mathematicians, physicists, chemists, and
civil and mechanical engineers.

COVERAGE: The book consists of 59 papers by Rumanian specialists on problems in
science and technology, particularly mathematics, physics, chemistry,
metallurgy, civil and mechanical engineering. Summaries in Russian and
French or German are given at the end of each article. Some of the articles
are accompanied by references. No personalities are mentioned. At the back
of the book there are 23 references, all Rumanian.

TITLE : Data on Inheritance of Pattern Components of
the Wooly Coat of Sheep and Lambs
ORIG. PUB. : Allattenyesztes, 1957, 6, No 1, 69-70

ABSTRACT : As a result of studies of the quality of skins of 589 Hungarian lambs, it was ascertained that the more valuable types of curls are inherited by the lambs, in a majority of the instances, from the sires rather than from the dams. The less valuable types of curlies are more often inherited from the dams. This is due to the fact that for centuries much attention has been given to the selection of rams. The valuable types of curlies are inherited, in a larger per cent of cases than the poorer ones, from both sires and dams. Variability of the hair pattern over the skin is transmitted more strongly from the maternal side. The pattern of the skin does not
